

DATASHEET

Axera Observe

Real-time, verdict-aware, process-attributed visibility into every east-west and egress flow — on any CNI, without a mesh.

Red Hat certified operator

CNI-agnostic

On-prem & air-gapped

eBPF-based

See every flow

You can't secure what you can't see. Axera Observe gives you a live, accurate map of every flow in and out of your clusters — without a service mesh, without changing your CNI.

Any-CNI flow visibility

An eBPF-based agent captures east-west and egress flows on OVN-Kubernetes, Cilium, Calico and more — no sidecars, no mesh required.

Verdict-aware

Flows carry the allow/drop verdict, so you see what your current policy already blocks — and what it doesn't.

Coverage & analytics

Know which workloads are covered by policy, where the gaps are, and how traffic trends over time.

Process attribution

Each flow is tied to the process and container that opened it, so a connection is never just an IP pair.

Egress you can trust

External connections resolve to destination IP and reverse-DNS, surfacing the data-exfil paths most tools never show.

Multi-cluster

One console across every monitored cluster, with per-cluster health and heartbeats.

Why it matters

- The same live map powers Segment (policy) and NDR (detection & response) — one source of truth
- No mesh, no CNI change, no SaaS — visibility that runs entirely in your clusters
- Upgrade in place to Segment and NDR when you're ready
